

ALGORITHM – SINGLE INHERITANCE

Inheritance Structure: $A \rightarrow B$

1. Start.
2. Create class A with variables **a = 100**, **b = 10** and method **sum()** to calculate $a + b$.
3. Create class B that extends class A. Set **a = 10**, **b = 50** and create method **sub()** to calculate $b - a$.
4. In the main() method, create an object **tv** of class B.
5. Call **tv.sum()**. Calculate $100 + 10$ and display **110**.
6. Call **tv.sub()**. Calculate $50 - 10$ and display **40**.
7. Display the results.
8. Stop.

Quick Flow

START → **Create A** → **Create B extends A** → **Create B object** → **sum()** → **sub()** → **Display output** → **STOP**

Output

sum is 110

subtraction is 40

Mnemonic: $A \rightarrow B$ = Single Inheritance
